

Complete On-Page & Technical SEO Audit

Prepared for www.ridhvickapparels.in — 18 July 2026

This audit was produced directly from the live codebase (React 19 + Vite + Express) and from web research into six real, currently-operating competitor manufacturers. Search-volume and keyword-difficulty figures throughout the accompanying SEO/ package are directional planning estimates, not live tool data (no Ahrefs / SEMrush / Google Keyword Planner connection was available) — see SEO/README.md for the full methodology note. Performance and accessibility scores below are a static code/asset audit, not a live Lighthouse run; re-verify with PageSpeed Insights once deployed.

Scorecard

"Current" reflects the site exactly as it exists today (a single-page app with the on-page tags already fixed in an earlier session). "After This Package" assumes every item in report/checklist.md Phases 1-2 is implemented. "After Multi-Page Migration" additionally assumes Phase 3 (the 9-page architecture) ships — see SEO/README.md Finding #1.

Category	Current	After This Package	After Multi-Page Migration
SEO Score	38	62	85
Technical Score	35	70	88
Content Score	40	48	80
Performance Score	30	78	80
Accessibility Score	65	68	75
Best Practices Score	50	88	90

Best Practices jumps sharply after Phase 1 mainly because of one item: the SSL certificate mismatch (README Finding #2) is scored as a Best-Practices failure until fixed — it's cheap to fix and disproportionately damaging while broken.

Key Findings

CRITICAL **SSL certificate mismatch on the live domain**

ridhvickapparels.in currently serves a certificate for host9.cloudindianserver.com, not its own domain. Every visitor sees a browser security warning. Fix in cPanel (AutoSSL) before driving any traffic.

CRITICAL **Site is a single crawlable page**

App.tsx renders Home, Catalog, Manufacturing, and Contact as anchor-scrolled sections of one document, not separate URLs. Google can only index one page. This caps every other optimization in this report — see the full recommended 9-page architecture in content-plan.md.

HIGH **53.8MB of uncompressed images**

All 28 images in public/images/ are unresized, uncompressed PNGs (1.3-2.5MB each). This is the dominant Largest Contentful Paint risk on the site. Full remediation plan in technical/performance-report.md and images/image-seo.md.

HIGH **Product images hosted off-domain**

Every product photo in src/data/uniforms.ts and catalogPages.ts is a lh3.googleusercontent.com preview link, not a real production asset. No caching control, no image-search attribution to your domain, and a reliability risk if the link ever expires.

HIGH **Zero structured data (schema.org) on the live site**

No Organization, WebPage, FAQPage, or LocalBusiness JSON-LD exists today. All are drafted and ready to deploy in SEO/schema/ — see report/checklist.md Phase 1.

MEDIUM **About Us content does not exist**

No page or section tells the Ridhvik founding story, states real production capacity, or names any point of accountability. Zero competitors reviewed do this well either — it's a genuine, low-competition trust-signal opportunity (see metadata/about.md).

MEDIUM **Render-blocking font import**

src/index.css loads Google Fonts via a CSS @import, adding a 3-hop sequential network chain before headline text can render. One-line fix documented in performance-report.md.

LOW **Mobile responsiveness and touch targets are already solid**

44px minimum touch targets, responsive Tailwind breakpoints, and a recently-redesigned compact header are already in good shape across the codebase — noted as a strength, not a gap.

Priority Tasks

High Priority

Fix the SSL certificate mismatch before driving any traffic to the domain
Deploy the real build to replace the current placeholder page
Compress and self-host all 28 site images (53.8MB to target ~4-5MB)
Self-host product images instead of lh3.googleusercontent.com links
Deploy Organization + WebSite + WebPage + FAQPage JSON-LD to the live homepage
Deploy robots.txt, sitemap.xml, and image-sitemap.xml to production

Medium Priority

Build the 9-page recommended URL architecture (content-plan.md, Section 1)
Fix the render-blocking Google Fonts @import
Code-split AiChatAssistant, QuickViewModal, and CartDrawer
Write real About Us content (founding story, capacity, QC standard)
Publish real MOQ and lead-time figures on the Manufacturing page
Set up and fully complete a Google Business Profile listing

Low Priority

Add geo coordinates and opening hours to LocalBusiness schema
Self-host web fonts via @fontsource instead of Google Fonts CDN
Add size-adjust font-face descriptors to reduce font-swap layout shift
Launch a blog against the topic clusters in content-plan.md, Section 3
Populate Review/AggregateRating schema once real customer reviews exist

Quick Wins (highest impact for lowest effort)

- Deploy the 4 JSON-LD schema files already drafted for the homepage — zero design work, copy-paste into index.html
- Swap the current public/robots.txt and sitemap.xml for the versions in SEO/ — already written, ready to deploy
- Delete the render-blocking @import line in index.css and add the two preconnect tags — a two-line change
- Fix the SSL certificate in cPanel AutoSSL — typically a few clicks, outsized trust impact

Full detail behind every finding and score in this report lives in the accompanying SEO/ package: README.md, keyword-strategy.md, content-plan.md, schema/, metadata/, social/, images/, technical/, and report/checklist.md + implementation-guide.md.
